Income Trends in Ohio Communities

Inequality Rises as Jobs Vanish

*By George Zeller
Economic Research Analyst
June 2008*

Summary

Growth in the income of an average taxpayer has been very uneven across Ohio. During the last two decades, incomes rose briskly among taxpayers in already affluent communities. At the same time, incomes fell on a widespread basis within Ohio's low income communities. In addition, incomes fell sharply in Ohio's cities while they rose sharply in suburban areas surrounding those cities. The gap between incomes received by average taxpayers in high income communities and incomes received by average taxpayers in low income communities has continually grown.

However, during the 2000s recession, the degree of income inequality between high income communities and low income communities weakened within Ohio. Incomes fell for the typical Ohio taxpayer during much of that recession in both high income communities and in low income communities. The damage to incomes of Ohio taxpayers during the 2000s recession was very widespread. Mean incomes fell for the average taxpayer by 4.4% in Ohio between 2000 and 2005. The median income of a taxpayer simultaneously fell by 7.2% during the first five years of the 2000s recession in Ohio through 2005.

Growing inequality was fed by imbalances caused by the lengthy impact of the 2000s recession in Ohio. Ohio lost 4.6% of its jobs but only 1.9% of its aggregate real paycheck earnings during the 2000s recession. Thus, real paycheck earnings of surviving jobs actually increased during the recession, particularly after 2004. Increasing aggregate earnings at the same time as employment totals fell caused income inequality to begin rising once again in 2005 within the state.

Definitions

Data on the income of an average taxpayer are from the Ohio Department of Taxation, derived from adjusted gross income figures on Ohio state income tax returns. This income definition for Ohio taxpayers is identical to the definition used by the federal Internal Revenue Service when calculating the adjusted gross income of a taxpayer on federal tax returns. In this report incomes are reported for both mean and median taxpayers, with the data expressed in real 2005 dollars using the Consumer Price Index as the inflation adjustment. Data on mean incomes of taxpayers are available for all years between 1986 and 2005. Data for median incomes of taxpayers are only available for

years between 1993 and 2005. Income measures are available for Ohio's 612 school districts as they were defined in 2001, and for all 88 Ohio counties.

The Data

Since the mid-1980s there has been a very substantial rise in the income of average taxpayers within affluent Ohio communities. That trend weakened temporarily during the 2000s recession, but a long term pattern of rising income inequality in Ohio remains. Incomes have risen sharply among taxpayers in high income communities, while at the same time incomes fell among taxpayers in low income communities.

Growth in the inequality of incomes among Ohio communities ceased during the 2000s recession on a nearly universal basis. Inequality of incomes declined across Ohio between 2000 and 2004. This declining inequality was not caused by a rise in the income of average taxpayers in low income communities during recession years. Instead it was caused by a nearly universal decline in the income of taxpayers in high income communities. At the same time, the income of average taxpayers continued to fall among low income communities in Ohio.

A break in the long term pattern of rising income inequality within Ohio would normally be a welcome development. But, in Ohio, decreasing levels of income inequality since 2000 have been caused by declining incomes for taxpayers in communities all across Ohio. The income declines were associated with job and paycheck losses during the extended 2000s recession and with asset wealth losses in equity and housing markets. Between 2000 and 2005 Ohio lost 204,308 jobs, which was 3.8% of total employment in the state. Since 2005, Ohio lost an additional 13,500 jobs through the beginning of the second quarter of 2008. The devastating impact of the 2000s recession on incomes across Ohio was nearly universal. The rich got poorer, and the poor got poorer at the same time.

However, by 2005 the velocity of job and earnings losses in Ohio slowed in comparison to the rapid prior job losses during the 2000s recession. In fact, earnings losses from the 2000s recession halted altogether in Ohio in 2005. These improved conditions in the Ohio economy for paycheck earnings were disproportionately concentrated among high income workers. They came at the same time while employment losses continued. As a result, growth in the inequality of incomes within Ohio resumed in 2005.

Mean Income vs. Median Income

There is often a significant difference between the mean income in a community and the median income in that community. The *mean* income of a taxpayer is calculated in this report as aggregate income divided by the number of taxpayers in a school district. The *median* income of a taxpayer is the midpoint of the income distribution in a community. Half of all taxpayers have incomes higher than the median, while the other half have incomes that are below the median. Mean incomes in a community can be significantly increased by the presence of a handful of very high income taxpayers. That problem does

not impact median incomes, which are a more realistic measure of typical taxpayers in a jurisdiction. Unfortunately, while mean incomes are available annually in Ohio since 1986, annual median income data in Ohio communities are only available since 1993.

Trends in the income of taxpayers within Ohio vary considerably between the *mean* and the *median*. The mean income of an Ohio taxpayer is currently \$48,597. The median income of an Ohio taxpayer is currently \$31,807. The income of affluent Ohio residents pulls the value of the mean income to a higher level than the value of the median income of a typical taxpayer. During the twelve year period between 1993 and 2005, the real mean income of an Ohio taxpayer *increased* by 10%. At the same time, the real median income of an Ohio taxpayer was nearly stagnant with an increase of only 0.4%. The income trend figures measure long term growth among high income Ohio taxpayers, even while the income of the typical median Ohio taxpayer simultaneously was almost unchanged.

Income Growth During the 2000s Recession and During the 1990s

The income of the average Ohio taxpayer declined during the 2000s recession, both as measured by mean income and median income. Between 2000 and 2005, the mean income fell by 4.4% in Ohio as a result of the recession. This was not only true on a statewide basis, but it also was true in Ohio counties. The mean income of a taxpayer decreased between 2000 and 2005 in 68 of Ohio’s 88 counties (see Table Three). The twenty exceptions were found in Harrison, Carroll, Union, Madison, Warren, Morgan, Hamilton, Lawrence, Auglaize, Medina, Jackson, Adams, Holmes, Portage, Allen, Wayne, Scioto, Belmont, Clinton, Highland, Guernsey, and Mahoning Counties.

The median income of a taxpayer in Ohio also declined during the 2000s recession, with a five year decline through 2000 of 7.2%. The decline in the state’s median income was more rapid than the 4.4% decline in its mean income. That indicates that the degree of income inequality increased within Ohio during the first five years of the 2000s recession. (See Table One for data in all Ohio communities).

A considerably different pattern is evident in long term mean income growth between 1986 and 2005. The 2000s recession cut incomes on a widespread basis within Ohio. But,

despite that damage from the 2000s recession, the mean income of a taxpayer increased between 1986 and 2005 in 47 of Ohio's 88 counties (see Table Three). The fastest increases came in rapidly developing urban sprawl counties adjacent to Cleveland and Columbus in Delaware, Warren, and Geauga Counties. High income residential development in those counties caused mean incomes to rise sharply over the period of nearly two decades.

Income data for counties obscure a considerable amount of internal variation within those counties. At the community level, measured as school districts in this report, the situation during the 2000s recession and during 15 years preceding the recession was very different than patterns measured for counties as a whole. During the period of nearly two decades between 1986 and 2005, the real mean income of a taxpayer increased in 347 of Ohio's 612 school districts, while real mean incomes fell among the other 43% of Ohio's school districts. The communities where incomes increased are heavily dominated by high income communities, while incomes simultaneously fell in most low income communities. (See Table Two)

Once the 2000s recession started, that pattern of rising mean incomes reversed. In 136 of Ohio's 612 school districts, mean incomes increased during the 2000-2005 recession years. In the other 476 districts, representing 78% of the state's school districts, mean incomes fell between 2000 and 2005. Substantial losses of employment and earnings in Ohio during the 2000s recession years caused mean incomes to fall in the overwhelming majority of communities on a statewide basis. An even more stringent pattern was evident in median incomes. (See Table One)

Only 52 of Ohio's 612 school districts experienced growth in the median income of their taxpayers during the 2000s recession. Those 52 Ohio school districts are a heterogeneous minority of the state's communities. These exceptions to the general pattern include some (but by no means all) of the affluent suburban communities surrounding Ohio's large cities. Eight of the ten school districts with the highest current median income levels in Ohio experienced median income growth even during the 2000s recession. Hudson in Summit County and Oakwood in Montgomery County were the two exceptions.

Much of the income growth in the 52 school districts where median incomes increased during the 2000s recession took place during the one year period between 2004 and 2005. Among Ohio's 30 most affluent communities as measured by current median income, only one (Ottawa Hills in Lucas County) did not register growth in its median income between 2004 and 2005. In fact, slightly over half of Ohio's school districts benefitted from a one year median income increase in 2005. Statewide, 309 of the 612 school districts had median income growth during that single year.

Nevertheless, that short term income growth was insufficient to overcome prior income losses during the 2000-2004 years, and most Ohio school districts continued to suffer cumulative income declines during longer periods of time since 1986 and 1993.

While median incomes increased in only 52 of Ohio's 612 school districts during the 2000s recession, representing only 8.5% of those districts, the mean income of a taxpayer also fell in 486 of Ohio's 612 school districts, meaning that mean incomes increased in 20.6% of those districts while they fell in 79.4% of all districts. Large job and earnings losses associated with the 2000s recession caused these very widespread income declines. Simultaneously falling mean and median incomes indicate that the recession's impact was extremely broad across the state of Ohio.

The trend in the typical median income of a taxpayer was considerably different over a longer period of years. Data on median income are only available since 1993 for Ohio school districts. The median income increased in more than half of Ohio's school district communities between 1993 and 2005, as median incomes grew in 312 of Ohio's 612 school districts (see Table One). Virtually all of this growth came between 1993 and 2000, during an extended period of job and paycheck earnings growth in Ohio. This growth period was parallel to a lengthy business cycle expansion in the United States as a whole, as the nation recovered from the 1990s recession.

Income growth in Ohio school districts reversed substantially after 2000. 79.4% of all Ohio school districts experienced a decline in their mean income during the 2000s recession years. During the 2000s recession, mean income increased in 126 districts, representing 20.6% of Ohio's school districts, and median income increased within a dramatically smaller 2.9% of Ohio's school districts during the 2000s recession (see Table Two).

Widespread income growth between 1986 and 1999 in Ohio school districts reversed dramatically after 2000. 79.4% of all Ohio school districts experienced a decline in their mean income during the 2000s recession years. During the 2000s recession, mean income increased in 20.6% of Ohio's school districts, and median income increased within an even smaller 8.5% of Ohio's school districts during the 2000s recession. Income declines were a nearly universal phenomenon in communities throughout Ohio as a result of the lengthy 2000s recession. The number of exceptions was small. Only 33 Ohio school districts experienced increases in both their mean and median incomes during the 2000s recession. Only four of those districts were located within Cuyahoga County: Beachwood, Solon, Chagrin Falls, and Orange.

Long Term Income Trends During 1986-2005

The situation has been considerably different across Ohio during the nineteen year period between 1986 and 2005. Incomes rose substantially in Ohio's high income communities

as incomes fell in low income districts. All of the fastest mean income increases during the 19 year period were in high income communities.

At the same time, mean incomes fell for the average taxpayer in many low income Ohio communities. The 20 fastest 1986-2005 declines in real mean incomes all suffered losses of at least 18%. All but three of these rapid declines were found among Ohio's 100 lowest income communities. The exceptions were Xenia in Greene County, West Carrollton in Montgomery County, and Howland Local in Trumbull County. All other rapid declines in mean income of taxpayers were found among the state's lowest income communities. As mean incomes increased in affluent communities they simultaneously fell rapidly in disadvantaged communities. The only two large Ohio cities on this list of rapidly declining mean incomes are Toledo and Akron.

Long term trends in the median income of an Ohio taxpayer are similar to trends seen in mean incomes. Median incomes rose in high income communities, while at the same time median incomes fell for typical taxpayers in low income communities. Unfortunately, annual median income data are not available for Ohio school districts prior to 1993, so data are missing for the 1986-1992 period for which mean income are available.

The 20 fastest median income increases among Ohio communities between 1993 and 2005 were found primarily in communities where the median income is quite high. Other median income growth was seen in some suburban school districts adjacent to large cities, notably in Mahoning County's Lowellville district. A gain within unusual Lake Erie island districts, Middle Bass Local and North Bass Local, resulted from tourism related high income housing development on the islands. Other exceptions to the pattern were noted in New Knoxville Local in Auglaize County and Carrollton in Carroll County. Otherwise, the state's largest long term gains in median income took place among already affluent communities.

	OHIO MEDIAN		\$31,695	\$34,258	\$31,807	-7.2%	0.4%

While median incomes rose between 1993 and 2005 in affluent communities, median incomes among taxpayers fell in nearly all low income Ohio communities. The twenty fastest median income declines between 1993 and 2005 all came in school districts that suffered double digit percentage declines in the mean income of a taxpayer. All of the 20 fastest median income declines were in the bottom quarter of current median income among Ohio's 612 school districts. Among Ohio's urban areas, Akron, Springfield, and Toledo were among these 20 communities that experienced unusually rapid declines in the mean income of a taxpayer during the last two decades.

Thus, even when average incomes are measured as medians so that they capture typical taxpayers at the midpoint of the income distribution, low income communities have suffered large income declines. Those income declines resulted while incomes were simultaneously increasing in high income communities.

Affluent Communities Experience Long Term Income Increases

Since 1986 the mean income of a taxpayer has increased sharply by double digit percentages in all of Ohio's twenty most affluent school districts. In Plain Local (Franklin County) and in Indian Hill (Hamilton County) mean incomes more than doubled during the 1986-2005 period. Plain Local in New Albany is currently Ohio's most affluent school district, while Indian Hill is currently the state's fifth most affluent school district. Among Ohio's richest school districts, the cause of the state's smallest income growth during the period of two decades was a 10.4% decline in mean income during the 2000s recession in Shaker Heights (Cuyahoga County).

	OHIO MEAN		\$45,678	\$50,851	\$48,597	-4.4%	6.4%

At the same time, mean incomes fell in nineteen of Ohio's twenty lowest income school districts. The only exception was Western Local in Symmes Valley Local in Lawrence County, where the mean income increased by a small 1.2%. Most of Ohio's lowest income school districts suffered double digit mean income declines since 1986. That long term trend was made worse during the 2000s recession, when incomes fell sharply among nearly all of the communities with the lowest current incomes in Ohio. A single exception to the 2000s income decline in poor communities was within Claymont in Tuscarawas County, where the mean income increased by a tiny 0.1%. Sharply rising incomes in affluent districts, which occurred while incomes fell sharply in low income districts, document a long term rise in the inequality of incomes among Ohio communities.

Income Inequality Rises for Median Incomes

Among Ohio's 612 school districts, income inequality has increased over time when that income is measured by median income of a taxpayer. The twenty highest income districts in median income nearly uniformly experienced increases in their median incomes between 1993 and 2005. There was only one exception to this pattern. The exception was in Lakota Local in Butler County, where the median income of a taxpayer *declined* by 6.3% during the 2000s recession. Within the other 19 highest median income districts of Ohio, incomes rose during the 1993-2003 period, despite weak growth during the 2000s recession and an actual median income loss during the 2000s recession within Oakwood in Montgomery County.

Among Ohio's twenty lowest median income school districts, the opposite situation prevails. Median incomes fell between 1993 and 2005 in all of Ohio's twenty extremely low income districts. Median incomes fell both during the 1993-2005 years and during the 2000s recession in all twenty of these extremely low income communities. Median income losses exceeded 15% in New Boston Local, which has the lowest median income of any Ohio school district. Losses were even sharper in East Cleveland, which unfortunately competes with New Boston Local for the distinction of Ohio's poorest community. Two additional communities suffered median income losses exceeding 15%. They were Sandusky in Erie County and Northridge Local in Montgomery County.

These data clearly document a long term rise in the inequality of incomes among Ohio taxpayers. Communities where average taxpayers are affluent experienced rising incomes, while at the same time communities where average taxpayers have low incomes experienced falling incomes over time.

Ohio Cities Particularly Hard Hit by Income Declines

Ohio's urban school districts uniformly have seen income declines both during the last two decades and also during the 2000s recession. Since the cities in Ohio contain a large fraction of Ohio's population and employment, the widespread decline in the income of average taxpayers within urban areas is unusually troubling. The range of the urban income declines has been wide. Between 1986 and 2005, the mean income of a taxpayer fell in 17 of the 18 large urban school districts in Ohio. The single exception was in Cincinnati. The Cincinnati mean income growth was substantial, at 8.8%. All other Ohio cities experienced a decline in the income of their mean taxpayer since 1986. The declines in Toledo, and Lima were at least a stunning 20%, and the declines in the income of a mean taxpayer exceeded 15% in most Ohio cities during this period.

OHIO STATEWIDE MEAN		45,678	50,851	48,597	-4.4%	6.4%

During the 2000s recession years, no large Ohio city experienced an increase in the mean income of its taxpayers. Cleveland had maintained this distinction through 2004, but a decline in Cleveland's mean income in 2005 wiped out prior 2000s gains within Cleveland. The city of Cleveland ranks only 598th among the 612 Ohio school districts in the mean income of its taxpayers. Canton, Lima, and Youngstown rank even lower among all Ohio communities, with current mean incomes within the bottom twelve figures among all 612 Ohio school districts.

When median incomes are used to define the income of a typical taxpayer, the long term income erosion within Ohio cities becomes even clearer. The median income of a typical taxpayer fell between 1993 and 2005 in **all 18** Ohio large urban cities. During the 2000-2005 recession years, median incomes fell by very steep margins in nearly all Ohio cities. There were no exceptions to the income declines among Ohio cities in their median incomes either during the 20 years since 1993 or during the 2000-2003 recession years. Only one large Ohio city, Cleveland, did not experience a double digit decline in median income during the 2000s recession. That "modest" decline in Cleveland during the 2000s recession was 9.9%, barely missing a double digit decline.

Income Inequality Rises in Cuyahoga County

One of the clearest examples within Ohio of rising income inequality has been Cuyahoga County, the state's largest urban county. When measured by mean income data, there have been large double digit percentage increases since 1986 within thirteen of Cuyahoga County's high income communities. Incomes went up by more than 10% since 1986 in all three Cuyahoga County school districts where the mean taxpayer makes more than \$100,000 per year. At the same time, incomes fell in all fourteen Cuyahoga County school districts where the average taxpayer makes less than \$54,000 per year.

During the 2000s recession the mean income of a taxpayer declined in all Cuyahoga County school districts except Beachwood, Solon, Chagrin Falls, and Orange. Those four districts are among the 17 most affluent school districts in Ohio. Cleveland had experienced a tiny 0.1% gain through 2004, but a mean income loss in Cleveland during 2005 created a 2000s recession decline in Cleveland. The small 0.1% gain in Cleveland's mean income had been associated with in-migration of higher income taxpayers as a result of Cleveland's policy of subsidizing new market rate housing construction within the city. But, that happy news was swamped by a 2005 decline in Cleveland's mean.

A similar pattern emerges in data on the median income of a taxpayer in Cuyahoga County school districts. The median income of a taxpayer generally increased in affluent Cuyahoga County school districts, both during the period between 1993-2005 and also during the 2000s recession. In sharp contrast, lower income communities suffered median income declines both during the two decade period and also during the 2000s recession.

Large median income growth within affluent communities in Cuyahoga County was replicated in other suburban areas of Summit, Medina, Geauga, and Lorain counties within the Cleveland-Akron-Lorain Elyria metropolitan statistical area (see Table 2). As incomes fell for typical taxpayers in Cleveland, Akron, Lorain, and Elyria, incomes simultaneously soared in rapidly developing high income sprawl communities in Cuyahoga, Lorain, and Summit Counties.

Income trends in Ohio counties

Table Three measures the trend in mean incomes between 1986 and 2005 in all 88 Ohio counties. Even though data for counties lose a considerable amount of the detail that is provided in Table One and Table Two for school districts, rising income inequality is

clearly evident in data for the 88 counties. Since 1986, the income of an average taxpayer rose by more than 15% in seven rapidly developing suburban sprawl counties adjacent to Ohio's large urban cities. Mean incomes also increased in the heavily Amish Holmes County and in Hamilton County that contains Cincinnati. Simultaneously, the mean income of a taxpayer fell since 1986 in 41 of Ohio's 88 counties. The suburban counties with rapidly rising mean incomes include Delaware, Warren, Geauga, Union, Carroll, Madison, and Medina Counties. With the exception of the heavily Amish Holmes County, each of the counties with large income increases is developing rapidly through sprawl development adjacent to Cleveland, Cincinnati, Columbus, and Canton.

Table Three finds that during the 2000s recession, income declines were the norm virtually everywhere in Ohio. The mean income of a taxpayer fell during the recession in 66 of Ohio's 88 counties. The complete list of exceptions is Harrison, Carroll, Union, Madison, Warren, Morgan, Hamilton, Lawrence, Auglaize, Medina, Jackson, Adams, Holmes, Portage, Allen, Wayne, Scioto, Belmont, Clinton, Highland, Guernsey, and Mahoning Counties.

The largest income declines between 1986 and 2005 among Ohio counties were double digit percentage losses in Monroe, Sandusky, and Crawford Counties. Ohio's statewide increase was 10.4% during this two decade period, but that was cut sharply by a 10.4% decline during the 2000-2005 recession years.

Income trends at the county level in Ohio's 88 counties are consistent with the more detailed trends in Ohio's 612 school districts. During the last two decades, incomes rose in communities where the average taxpayer had a high income. Simultaneously, incomes fell in communities where the income of the average taxpayer is low. There is no doubt that the level of income inequality has grown substantially in recent years within Ohio.

However, during the 2000s recession, the long term rise in the inequality of income among Ohio taxpayers slowed. Incomes fell on a very widespread basis in both affluent communities and in low income communities. Ohio entered the 2000s recession earlier than the rest of the United States did, and the state's recovery from the recession has been dramatically and continuously slower than a simultaneous recovery in the rest of the United States. Despite widespread income damage in Ohio from the 2000s recession, both among low and high income communities, during the last two decades the rich got poorer and the poor got poorer across Ohio. Over the long run, there has been a substantial and widespread increase in the degree of income inequality across Ohio.

Correlations

Among Ohio's 612 school districts, the zero order correlation between the percentage increase in the income of a school district and the mean income of that school district is nonzero. But, the relationship between the level of income in Ohio school districts and growth in that income has varied somewhat during different periods of time. During the 2000s recession, income growth was strongly correlated with the level of income in the school districts. About 55% of the variance of growth in the mean income within the

school districts can be explained by the level of mean income in those districts. That is a substantial and significant level of correlation.

**Correlations between Income Growth and Current Income
Current 2005 Mean and Median Income vs. Income Growth
93-05, 00-05, and 04-05 in 612 Ohio School Districts**

<u>VARIABLE</u>	<u>INCOME GROWTH 1993-2005</u>	<u>INCOME GROWTH 2000-2005</u>	<u>INCOME GROWTH 2004-2005</u>
2005 Mean Income	0.297	0.740	0.073
2005 Median Income	0.471	0.593	0.375

The other correlations are less robust during the two decades between 1993 and 2005 and during the most recent one year period between 2004 and 2005. But, all of these correlations are positive and nonzero, except for the one year growth trend through 2005 in mean income.

These correlations are consistent with the proposition that income inequality has risen since 1993 in Ohio, with substantial growth in the income of affluent school districts, while the income of lower income school districts fell or rose slowly. It is also consistent with the fact that incomes fell during the 2000s recession on a widespread basis in Ohio, with incomes falling both in high income and low income communities. But, in 2005 incomes generally began to increase again in Ohio, particularly in higher income communities. But, that moderation in Ohio's income losses in 2005 was very small, and was insufficient to make up for much larger losses during the first four years of the 2000s recession.

Income Inequality Increases Again in Ohio in 2005

Aggregate paycheck earnings actually increased in Ohio in 2005, even as employment in Ohio remained sluggish as a result of the 2000s recession. This continued an imbalanced pattern between trends and employment and trends in earnings in Ohio during the 2000s recession. Employment levels declined faster than earnings levels declined. As a result, the average earnings of a surviving job actually increased in Ohio during the recession. This created two quite different patterns among Ohio workers. On average, those who lost their employment saw their incomes plunge to zero. Meanwhile, workers who remained employed, on average experienced rising real earnings and thus rising incomes.

Aggregate Real Earnings from Ohio Employment 2000-2007

SOURCE: ODJFS QEW ES-202 Complete Count of Jobs and Earnings

<u>YEAR</u>	<u>AGGREGATE EARNINGS</u>	<u>ONE YEAR % INCR EARNINGS</u>	<u>TOTAL EMPLOYMENT</u>	<u>ONE YEAR % INCR EMPLOYMENT</u>
2000	\$201,516,563		5,426,617	
2001	\$198,332,519	-1.6%	5,357,834	-1.3%
2002	\$198,490,234	0.1%	5,223,405	-2.5%
2003	\$197,796,799	-0.3%	5,193,169	-0.6%
2004	\$197,075,753	-0.4%	5,197,961	0.1%
2005	\$198,803,610	0.9%	5,222,309	0.5%
2006	\$197,311,559	-0.8%	5,236,641	0.3%
2007	\$197,612,412	0.2%	5,218,576	-0.3%
2000-2007	-\$3,904,151	-1.9%	-\$208,041	-3.8%

These diverging patterns within Ohio's labor market resulted in a resumption of rising income inequality within the state as measured in 2005. The outlook for incomes in Ohio during 2006 and 2007, for which data are not yet available, is similar. Aggregate earnings fell in 2006 within the state, but they once again increased in 2007 even as job losses returned to the Ohio as the national economy slowed sharply. It is therefore likely that measures of current income inequality in this report are conservative, given the time delay prior to the availability of annual income data within Ohio communities.

Acknowledgment

George Zeller thanks the Cuyahoga County Board of Commissioners for their important financial support that made this report possible.
